

SUMMARY

Data Analyst specializing in **data management, accurate reporting, forecasting**, and operational **decision-making** across **renewable energy**, manufacturing, finance, and enterprise analytics environments. Hands-on experience integrating production, inventory, financial, and operational data using **SQL, Power BI, Python, Microsoft Fabric, and Snowflake**. Proven ability to collaborate with **operations, finance, engineering, and internal stakeholders** to strengthen **data accuracy and completeness**, production reporting, **revenue tracking and reconciliation**, and recurring business reporting.

SKILLS

BI and Reporting:	Power BI , Power BI Service, Report Development, Paginated Reports, DAX , Power Query (M) , KPI Development, Row Level Security (RLS)
Data and Analytics:	SQL , T-SQL, Python , forecasting , statistical analysis, trend analysis, variance reporting, ad hoc analysis , anomaly detection, root cause analysis, data validation , data reconciliation
Platforms and ETL:	SQL Server , SSMS, Snowflake , Microsoft Fabric , Lakehouse, SSIS , ADF, ETL/ELT , dimensional modeling, star schema, data warehouse development
Automation and Systems:	Power Automate , Microsoft Forms, SharePoint, Git, APIs, SAP ERP , ERP systems, MES systems, deployment pipelines
Business Analytics:	finance reporting , revenue reporting, production analytics , inventory analytics, manufacturing analytics, supply chain analytics, KPI standardization

EXPERIENCE

Data Analyst Clutchpoint	<i>Oct 2025 – Present</i>
- Designed and developed enterprise Power BI dashboards analyzing financial, operational, revenue, and business-performance metrics, improving decision-making speed by 27% through KPI visualization, drill-down reporting, and actionable performance insights. - Conducted statistical analysis, trend analysis, variance reporting, and forecasting across revenue and operational datasets, helping summarize trends for finance teams and internal stakeholders while supporting informed business decisions. - Partnered with finance teams and internal stakeholders to validate datasets, reconcile revenue and operational KPIs against authoritative systems, and support revenue tracking and reconciliation, improving data accuracy and completeness by 31% through structured data-quality controls. - Developed reusable SQL source and validation queries integrating APIs, databases, and multiple business systems while automating ETL/ELT workflows, achieving 43% faster report delivery through standardized SQL frameworks and scalable reporting logic. - Built governed reporting datasets using Microsoft Fabric Lakehouse, dimensional models, and standardized KPI definitions to support financial reporting, forecasting, executive reporting, and self-service analytics initiatives. - Enhanced dashboard usability through intuitive interfaces, visual hierarchy, interactivity, and navigation design, contributing to a 55% increase in dashboard adoption by improving report accessibility and end-user experience.	
Data Analyst First Solar	<i>Jul 2024 – Present</i>
- Designed SQL-based pipelines and automated ETL processes to extract, transform, validate, and ingest SAP ERP, manufacturing, testing, and production data into a centralized reporting layer within a renewable energy manufacturing environment. - Developed standardized KPIs and dashboards in PowerBI to track production volumes, manufacturing throughput, yield, inventory flow, and supply chain performance, improving reporting accuracy by 40% through standardized calculation logic and source-data validation. - Analyzed complex renewable-energy manufacturing and production datasets using SQL, statistical analysis, trend analysis, and root cause analysis to identify performance drivers affecting plant operations, reliability, engineering, and finance reporting. - Built real-time dashboards and regular reports enabling operations and business leaders to monitor utilization, production trends, inventory movement, manufacturing performance, and operational risk across weekly and monthly reporting cycles. - Collaborated with engineering, operations, research and development, and finance stakeholders to confirm production data, validate source-to-report consistency, and ensure data accuracy and completeness for operational and management reporting. - Simplified manual reporting workflows and standardized KPI calculation and validation logic, accelerating weekly and monthly reporting cycles while improving consistency across manufacturing, inventory, and production reports. - Prepared analytical outputs translating complex technical and production information into clear reporting and actionable findings, supporting resource planning, operational prioritization, and data-driven decision-making.	
ITS Technical Analyst Auburn University at Montgomery	<i>May 2023 – May 2024</i>
- Maintained enterprise reporting platforms and technical systems supporting 1,000+ users, ensuring platform stability, operational continuity, incident documentation, and standardized troubleshooting workflows across campus environments. - Investigated recurring system issues using root cause analysis and structured incident records, improving visibility into platform-reliability trends and supporting consistent resolution procedures.	
Data Engineer Seneca Global	<i>Jun 2021 – Dec 2022</i>

- Designed and maintained scalable **data warehouse solutions using Snowflake and SQL Server**, applying dimensional modeling and data warehouse standards to support enterprise business intelligence, reporting, and analytical systems.
- Developed **SQL-driven ETL pipelines using T-SQL, Python, and SSIS** to ingest, transform, validate, and prepare multi-source data into analytics-ready datasets for enterprise reporting.
- Implemented **dimensional data models and star-schema structures**, supporting reusable BI reporting models, standardized analytical outputs, and consistent KPI reporting across business environments.
- Optimized **ETL workflows and database queries**, reducing pipeline latency by **45%** while improving query performance through SQL tuning, workflow optimization, and structured data-transformation logic.
- Implemented **deployment pipelines and version-controlled releases** following Application Lifecycle Management principles across development, testing, and production environments, improving release consistency and reporting-system reliability.

SELECTED RENEWABLE ENERGY AND OPERATIONS ANALYTICS PROJECTS

Inventory Intelligence and Supply Chain Analytics Platform

- Analyzed **inventory and material-movement data using SQL and Power BI** to track inventory volumes, identify discrepancies, evaluate slow-moving materials, and detect operational bottlenecks affecting manufacturing and supply-chain performance.
- Developed **dashboards and regular reports** supporting inventory planning, material utilization, production coordination, supply-chain visibility, and operational decision-making across **renewable-energy manufacturing operations**.
- Implemented **reconciliation and validation frameworks** comparing source-system records with reporting outputs, reducing inventory data discrepancies by **50%** through automated controls and governed reporting procedures.

Automated Manufacturing Test Data Reporting Platform

- Built an **automated reporting platform using SQL and Python ETL workflows** to collect, validate, transform, and process large engineering and manufacturing test datasets from multiple source systems.
- Architected **Power BI dashboards, reports, and KPI visualizations** that translated complex technical and production information into actionable reporting for engineering, manufacturing, and operational stakeholders.
- Applied **automated quality checks and validation workflows** to improve data accuracy and completeness, accelerate verification activities, and strengthen the repeatability of manufacturing test-data reporting.
- Accelerated validation cycles by **75%** through automated quality checks and validation workflows, improving reporting timeliness, consistency, and repeatability across engineering test-data processes.

Operations Reliability and AI-Based Image Inspection Platform

- Developed **operations reliability analytics workflows** integrating **ERP, MES, manufacturing, and AI inspection data** to support defect monitoring, quality reporting, production analysis, and reliability-focused decision-making.
- Applied **Python-based machine-learning models, statistical analysis, anomaly detection, and root cause analysis** to identify defect patterns, evaluate recurring quality issues, and generate actionable findings for engineering and operations stakeholders.
- Built reporting outputs and visualizations that helped stakeholders monitor **production quality, defect trends, operational risk, and reliability indicators** across active renewable-energy manufacturing processes.
- Reduced recurring defects by **42%** through automated anomaly detection, defect-pattern analysis, root cause evaluation, and data-driven quality-improvement recommendations.

CERTIFICATIONS AND EDUCATION

Certifications: Microsoft Certified: Power BI Data Analyst Associate; Microsoft Certified: Fabric Data Engineer Associate

Master of Science in Management Information Systems — Auburn University at Montgomery

Bachelor of Technology in Computer Science and Engineering — K L University
